

Hand drawn method:

One way of making a wire frame is by drawing it out by hand. This would involve using some sort of paper or sketchbook to draw it on and a writing utensil, preferably one that can be easily manipulated if you wish to change something. I feel like drawing out your wire frame gives you the opportunity to go into more detail if you wish to do so. I also think that it allows you to get all of your thoughts down on paper in an easier way. While it might seem like more work, I think it is a great method to use in the long run.

Computer program:

Another way to go about making a wireframe is on the computer. You can use a program such as illustrator or even Microsoft word to get your ideas down. Using a method like this will allow you ideas and plans to be shown in a neat and clean way, whereas hand drawn wireframes can sometimes seem a little sloppy. However, I think that it is harder to go into detail when you use a computerized method. While you should avoid going into extreme detail when you are wire framing, I still think it is important to have some detail so those you're sharing it with have a good idea of what you're trying to accomplish.
